

# PRODUCT DATA SHEET

## Mouse Serum

### Description

Mouse serum is obtained from healthy laboratory animals that have been raised under strict barrier conditions and are monitored on a regular basis for murine pathogens. Controlled standard diets and adherence to strict collection and production protocols minimize lot-to-lot variations.

### Filtration

Approved lots of raw serum are thawed under controlled conditions and sterile filtered by an in-line process that uses a series of filters in descending pore size, utilizing 0.2 $\mu$ m filters for the final filtration step. Filling takes place in a laminar flow hood certified to maintain Class 100 conditions. The filling room is maintained under positive pressure with HEPA-filtered air. The serum is aseptically dispensed into gamma irradiated, sterile PETG or PETE bottles. Filled containers are immediately labeled and frozen, and then maintained at temperatures less than -5°C to preserve the product quality.

### Quality Control Testing

#### *Microbiological Testing:*

Each lot of serum is tested to confirm the absence of bacterial or fungal contamination using modified methods referenced in the U.S. Pharmacopeia (USP).

### Storage and Handling

The mouse serum is supplied in gamma irradiated, sterile PETG or PETE bottles. We recommend that the serum be stored frozen at a temperature of -5°C to -20°C. Multiple freeze-thaw cycles of the serum should be avoided as this may lead to deterioration of the product. If intermittent usage of the product is anticipated, we recommend use of either our smaller package sizes or dividing the serum into smaller aliquots suitable for single use. Always use aseptic techniques when handling the serum and aliquot into sterile containers.

### Shipping

Serum is shipped frozen by next day air in insulated containers packed with dry ice.
